In the Claims

- 1 1. (original) A wireless mobile communications network including a base station
- 2 and a plurality of mobile nodes, comprising:
- a first mobile node configured as a major node to communicate information
- 4 directly with the base station via a network link; and
- a second mobile node configured to communicate the information indirectly
- 6 with the base station via a local link with the major node and the network link from
- 7 the major node to the base station to form a locally linked mobile network within
- 8 the wireless mobile communications network.
- 1 2. (original) The wireless mobile communications network of claim 1 wherein each
- 2 mobile node further comprises:
- a header detector, coupled to a receiver and a decoder, configured to detect a
- 4 header in a frame used to communicate the information;
- a message processor, coupled to the header detector and a transmitter,
- 6 configured to route the frame over the network link and the local link.
- 1 3. (original) The wireless mobile communication network of claim 2 wherein the
- 2 header detector is connected to an output of the decoder and the locally linked
- 3 mobile network operates asynchronously.

- 1 4. (original) The wireless mobile communication network of claim 2 wherein each
- 2 mobile node further comprises a GPS receiver and the locally linked mobile
- 3 network operates synchronously.
- 1 5. (original) The wireless mobile communication network of claim 2 wherein the
- 2 major node communicates the frame while in standby mode, and the minor node
- 3 receives the frame in active mode.
- 1 6. (original) The wireless mobile communications network of claim 2 wherein the
- 2 mobile nodes are cellular telephones.
- 1 7. (original) The wireless mobile communications network of claim 1 wherein each
- 2 mobile node further comprises:
- a display, coupled to the message processor, to display a warning message
- 4 when the mobile node communicates information with the base station via the
- 5 network link and with the minor node via the local link.
- 8. (currently amended) The wireless mobile communications network of claim-1
- 2 <u>claim 2</u> wherein each frame includes a header.
- 1 9. (original) The wireless mobile communications network of claim 8 wherein the
- 2 header includes a code word, and control information.

- 1 10. (original) The wireless mobile communications network of claim 9 wherein the
- 2 code word is a Walsh code word.
- 1 11. (original) The wireless mobile communications network of claim 9 wherein the
- 2 code word is a forward code word and the control information includes a list of a
- 3 plurality of major nodes and a list of a plurality of minor nodes.
- 1 12. (original) The wireless mobile communications network of claim 9 wherein the
- 2 code word is a destination code word and the control information identifies the
- 3 minor node and the major node.
- 1 13. (original) The wireless mobile communications network of claim 9 wherein the
- 2 code word is a routing code word and the control information identifies the major
- 3 node and the control information indicates an amount of available bandwidth.
- 1 14. (original) The wireless mobile communications network of claim 9 wherein the
- 2 code word is a receive code word.
- 1 15. (original) The wireless mobile communications network of claim 2 wherein the
- 2 message processor of the major node replaces a forward code word in a header of
- 3 the frame with a receive code word, the forward code word identifying the major
- 4 node and the receive code word identifying the minor node.

- 1 16. (original) The wireless mobile communications network of claim 1 wherein the
- 2 base station monitors bandwidth of the locally linked mobile network.
- 1 17. (currently amended) The wireless mobile communications network of claim 1
- 2 wherein a size and shape configuration of the nodes of the locally linked mobile
- 3 network is adaptively adjusted by the basestation depending on need, traffic type,
- 4 link quality, coverage, utilized bandwidth, and mobility.
- 1 18. (original) The wireless mobile communications network of claim 1 wherein
- 2 each mobile node monitors a quality of the network link with the base station.
- 1 19. (original) The wireless mobile communication network of claim 4 wherein the
- 2 GPS receiver estimates position, speed, and bearing of the mobile node.
- 1 20. (original) The wireless mobile communication network of claim 4 wherein each
- 2 mobile node uses channel quality and mobility characteristics to determine
- 3 suitability for operating as the major node.
- 1 21. (original) The wireless mobile communication network of claim 1 wherein the
- 2 locally linked mobile network includes a plurality of major nodes configured to
- 3 communicate information with each other and the minor node.

- 1 22. (original) The wireless mobile communication network of claim 1 wherein the
- 2 base station includes a memory to store a configuration list to associate the major
- 3 node with the minor node.
- 1 23. (original) The wireless mobile communication network of claim 22 wherein the
- 2 minor node is associated with a plurality of major nodes.
- 1 24. (original) The wireless mobile communications network of claim 1 wherein
- 2 communicating of the information is dynamically routed to optimize a quality of
- 3 service of the wireless mobile communications network and the locally linked
- 4 network.

3

- 1 25. (original) The wireless mobile communications network of claim 1 wherein the
- 2 locally linked mobile network operates in multicast mode.
- 4 26. (original) The wireless mobile communications network of claim 2 wherein
- 5 each frame is encrypted using a pseudo random number sequence.
- 1 27. (original) The wireless mobile communication network of claim 1 wherein the
- 2 major node operates in active mode while receiving low bandwidth frames intended
- 3 for the major node, and high bandwidth frames intended for the minor node.
- 1 28. (original) The wireless mobile communications network of claim 1 including a
- 2 plurality of major nodes and the base station selects a particular one of the plurality

- 3 of major nodes to communicate with the minor node based on available bandwidth
- 4 between the major node and the base station.
- 1 29. (currently amended) The wireless mobile communications network of claim 1
- 2 including a plurality of base stations and a plurality of major nodes and minor and
- 3 major connecting nodes communicating with each other via network links and local
- 4 links.
- 1 30. (original) The wireless mobile communications network of claim 29 wherein a
- 2 first major node communicates with a first base station and a first minor node, and a
- 3 second major node communicates with a second base station and a second minor
- 4 node to enable the first and second minor nodes to communicate indirectly with
- 5 each other via the first and second major nodes and the first and second base
- 6 stations.
- 1 31. (original) The wireless mobile communications network of claim 29 wherein
- 2 minor nodes are dynamically assigned to different major nodes depending on a
- 3 quality of service of the network link and the local link.
- 1 32. (original) The wireless mobile communications network of claim 1 further
- 2 including an end of transmission signal to indicate an end of communicating the
- 3 information.

1 33. (original) A method for communicating information in a wireless mobile 2 communications network including a base station and a plurality of mobile nodes, comprising: 3 4 communicating information directly between a first mobile node configured 5 as a major node and the base station via a network link; and communicating the information indirectly between the base station and a 6 7 second mobile node configured as a minor node via the network link between the 8 base station and the major node and a local link between the major node and the 9 minor node. 34. (original) The method of claim 33 further comprising: 1 detecting a header of a frame received in the major node; and 2 3 routing the frame to the minor node via a message processor of the major 4 node. 35. (currently amended) In a wireless mobile communications network that includes 1 a base station and a plurality of mobile nodes, each mobile node comprising: 2 a receiver coupled to an antenna; 3 a header detector coupled to the receiver to detect a header in a received 4 5 frame from the base station; 6 a decoder coupled to the header detector to decode the received frame, the detected frame to be transmitted to another mobile node; 7 a message processor to reformat the frame; 8 9 an encoder to encode the reformatted frame; and

- a transmitter to transmit the encoded frame to the other mobile node.
 - 1 36. (original) The mobile node of claim 35 wherein the header detector is connected
- 2 to an output of the decoder and the plurality of mobile nodes operate
- 3 asynchronously.
- 1 37. (original) The mobile node of claim 35 wherein each mobile node further
- 2 comprises a GPS receiver and the plurality of nodes operate synchronously.
- 1 38. (original) The mobile node of claim 35 wherein the mobile node communicates
- 2 the frame while in standby mode, and the other mobile node receives the frame in
- 3 active mode.
- 1 39. (original) The mobile node of claim 35 wherein the header is a forward header
- 2 that identifies the other mobile node.
- 1 40. (original) The mobile node of claim 35 further comprising:
- a display, coupled to the message processor, to display a warning message
- 3 when the mobile node is communicate information between the base station and the
- 4 other mobile node.
- 1 41. (original) The mobile node of claim 35 wherein the mobile node monitors a
- 2 quality of the network with the base station.

- 1 42. (original) The mobile node of claim 1 wherein the mobile node is a cellular
- 2 telephone.
- 1 43. (original) The mobile node of claim 1 wherein the mobile node is a palm top
- 2 computing device.
